

AMENDMENTS TO THE ABSTRACT:

Please replace the paragraph (Abstract) beginning at page 24, line 1 with the following rewritten version:

Abstract

An ~~In an~~ air conditioner is configured with ~~comprising~~ a plurality of utilization units, such that an increase in the cost of parts constituting a refrigerant circuit is prevented even if the maximum working pressure of the refrigerant circuit increases. The ~~An~~ air conditioner ~~(1) comprises~~ has a plurality of utilization units (5), ~~and comprises~~ a vapor compression type refrigerant circuit (10) and with an accumulator (25). The refrigerant circuit (10) ~~comprises~~ has a high pressure unit (10a) ~~constituted by the connection of parts capable of flowing for~~ handling a high-pressure refrigerant at a maximum working pressure of 3.3 MPa or higher, and a low pressure unit (10b) ~~constituted by the connection of parts capable of flowing for~~ handling only low-pressure refrigerant at a maximum working pressure of less than 3.3 MPa. The accumulator (25) is one of the parts constituting the low pressure unit (10b); and is capable of pooling refrigerant circulating inside the refrigerant circuit (10) as liquid refrigerant. The refrigerant that flows through the low pressure unit (10b) and the high pressure unit (10a) is preferably R410A.
